Task:
1. Create a WebApi .NET 6 application that consumes data from https://restcountries.com/ API v3+
2. We are only interested in European Union countries, our internal data model only needs info on the country name, area, population, tld, native name (and any extra needed).
3. Create REST API for the following:
   a. Top 10 countries with the biggest population
   b. Top 10 countries with the biggest population density (people / square km)
   c. By passing a specific country (eg /country/latvia) return everything you have on that country in your model **except the country name**
4. Add unit tests
5. Swagger for the endpoints

Deliverables:
1. Link to a GitHub repository
2. Description of how to run your program
